CERES Science Team Meeting
May 7-9, 2019

Work done after the fall 2018 CERES meeting

- Revision of SYN1deg products (Edition 4.0 to Edition 4.1).
- Producing Edition 4.1 EBAF-surface
- Producing the difference of TOA and surface irradiances between clear-sky cloud removed and clear-sky observation sampled (Loeb's talk).
- MATCH aerosol optical thickness evaluation under partly cloudy conditions.
- Evaluation of MERRA2 and new GMAO skin temperatures, temperature profiles, and humidity profiles.
- Analysis of sea ice albedo depending on age of ice
- Comparison of deep blue and dark target aerosol optical thickness (Rutan's talk)
- Evaluation of daily mean computed TOA and surface irradiances by 2- and 4-steram models (Ham's talk)
- Changing MOA format (binary to HDF)

Outline of this talk

- Edition 4.1 SYN1deg and EBAF flux, aerosol, and cloud changes from Edition 4.0
- MATCH aerosol validation under partly cloudy conditions
- Evaluation of GMAO products, GEOS-5.4.1, MERRA, MERRA2, FP
 - How skin temperature bias affects surface flux computations
- Sea ice albedo
- Working in progress
 - Revision of Fu-Liou code k-distribution (with a help from Lusheng Liang)
 - C3M with Ed4 clouds and new versions of CALIPSO and CloudSat products

Edition 4.1 SYN1deg

- Edition 4.1 SYN1deg has been processed from March 2000 through September 2018 with
 - MATCH with Collection 6.1 Terra and Aqua (from July 2002)
 - Revised Himawari-8 cloud code
 - Tuning TOA fluxes to the latest TSI
 - Collection 5 MODIS from March 2000 through February 2016
 - Collection 6.1 MODIS after March 2016
 - New surface albedo history map with Collection 6 (not 6.1) MODIS BRDF product

Edition 4.1 EBAF-surface

- March 2018 is the final month of Edition 4.0
- Edition 4.1 EBAF-surface from March 2000 through September 2018 will be released soon.

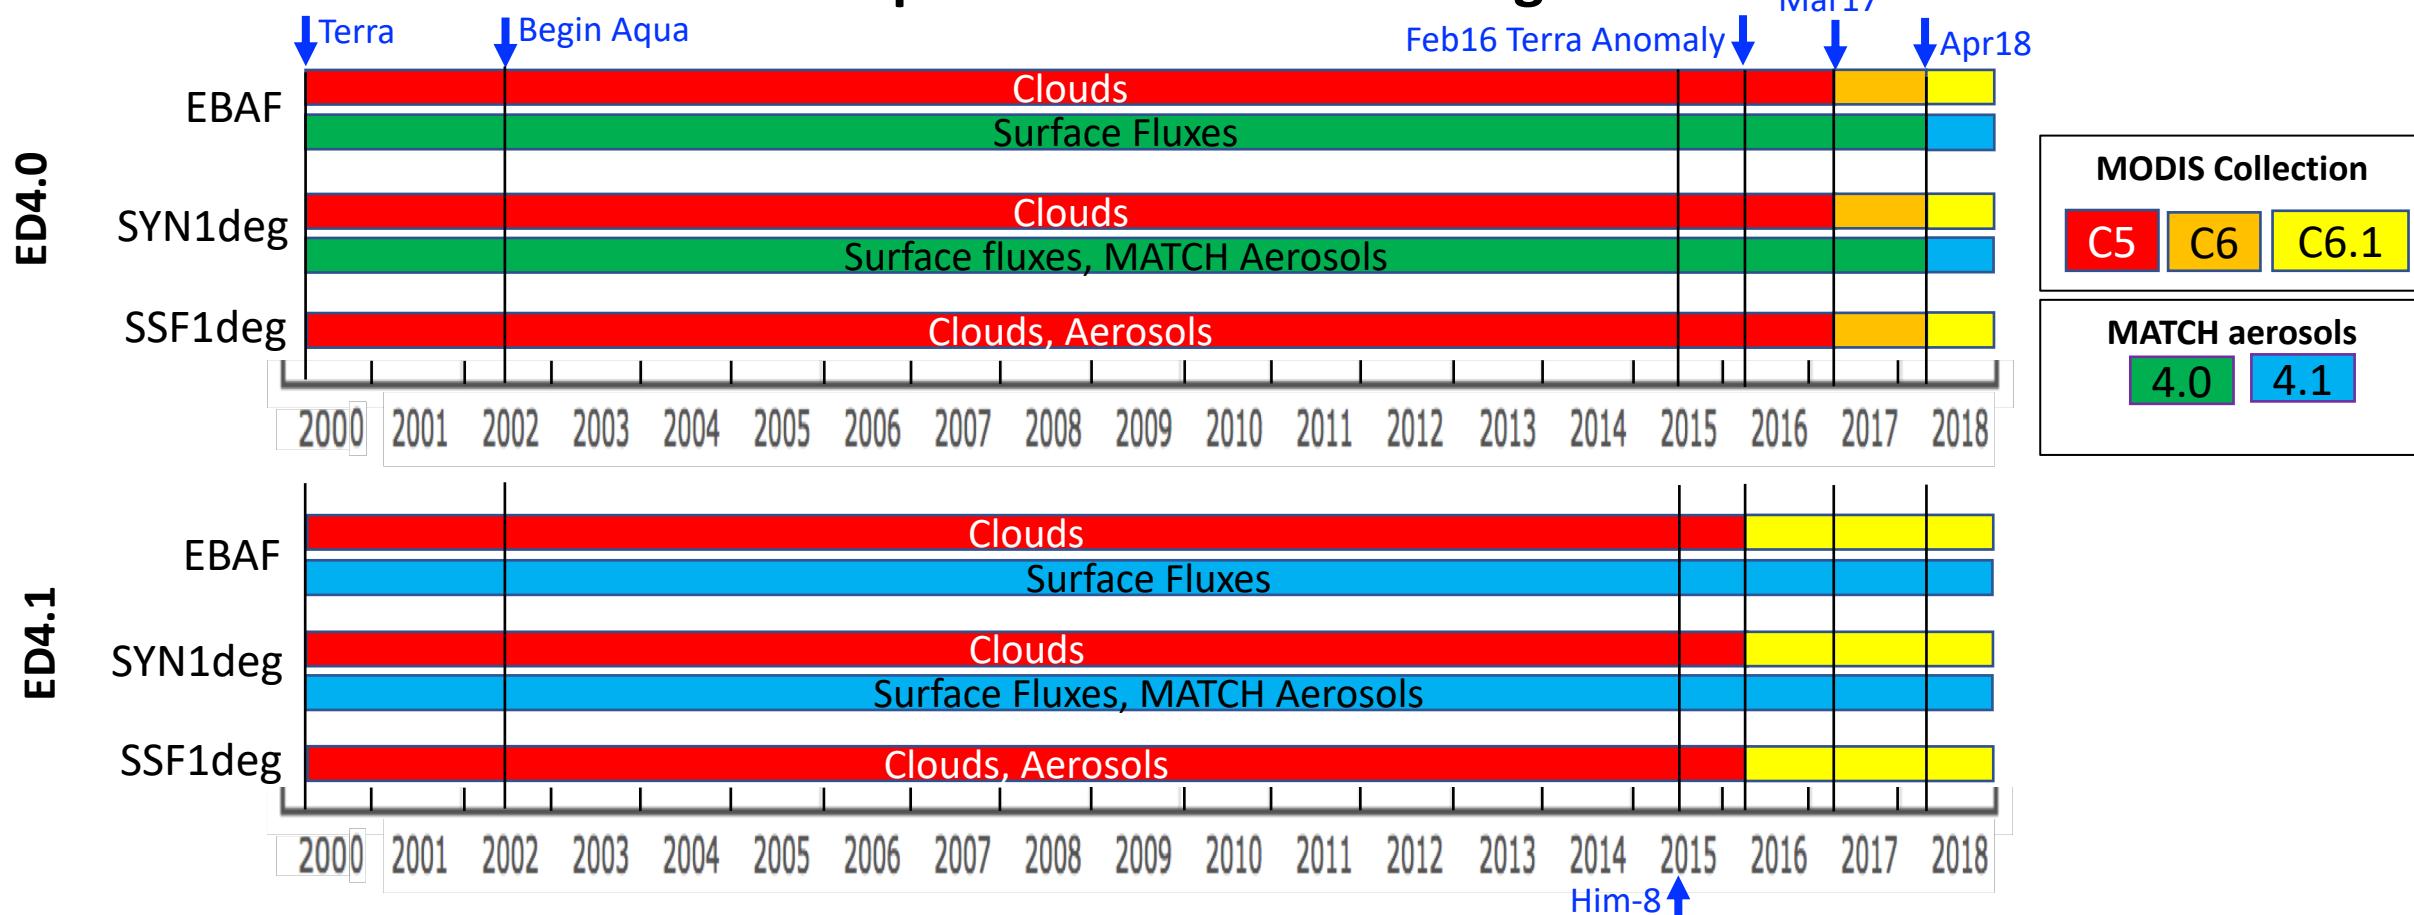

Issues affecting edition 4.0 EBAF-surface

- Large changes occur in polar night cloud fraction after March 2016 due to MODIS instrument issues
- A bug in the MODIS aerosol algorithm (Terra and Aqua dark target and deep blue) causes large differences in the aerosol optical thickness over land between collection 5 and collection 6.1.
- These problems do not affect observed TOA irradiances, but affect computed surface irradiances.
 - The effect of small compared with clear-sky adjustment but significant enough to introduce a discontinuity in clear-sky surface downward shortwave fluxes.
- Edition 4.0 EBAF-surface is available from March 2000 through March 2018.
- Edition 4.1 EBAF-surface will replace Ed4.0 for the entire record.

Edition 4.1 EBAF-surface

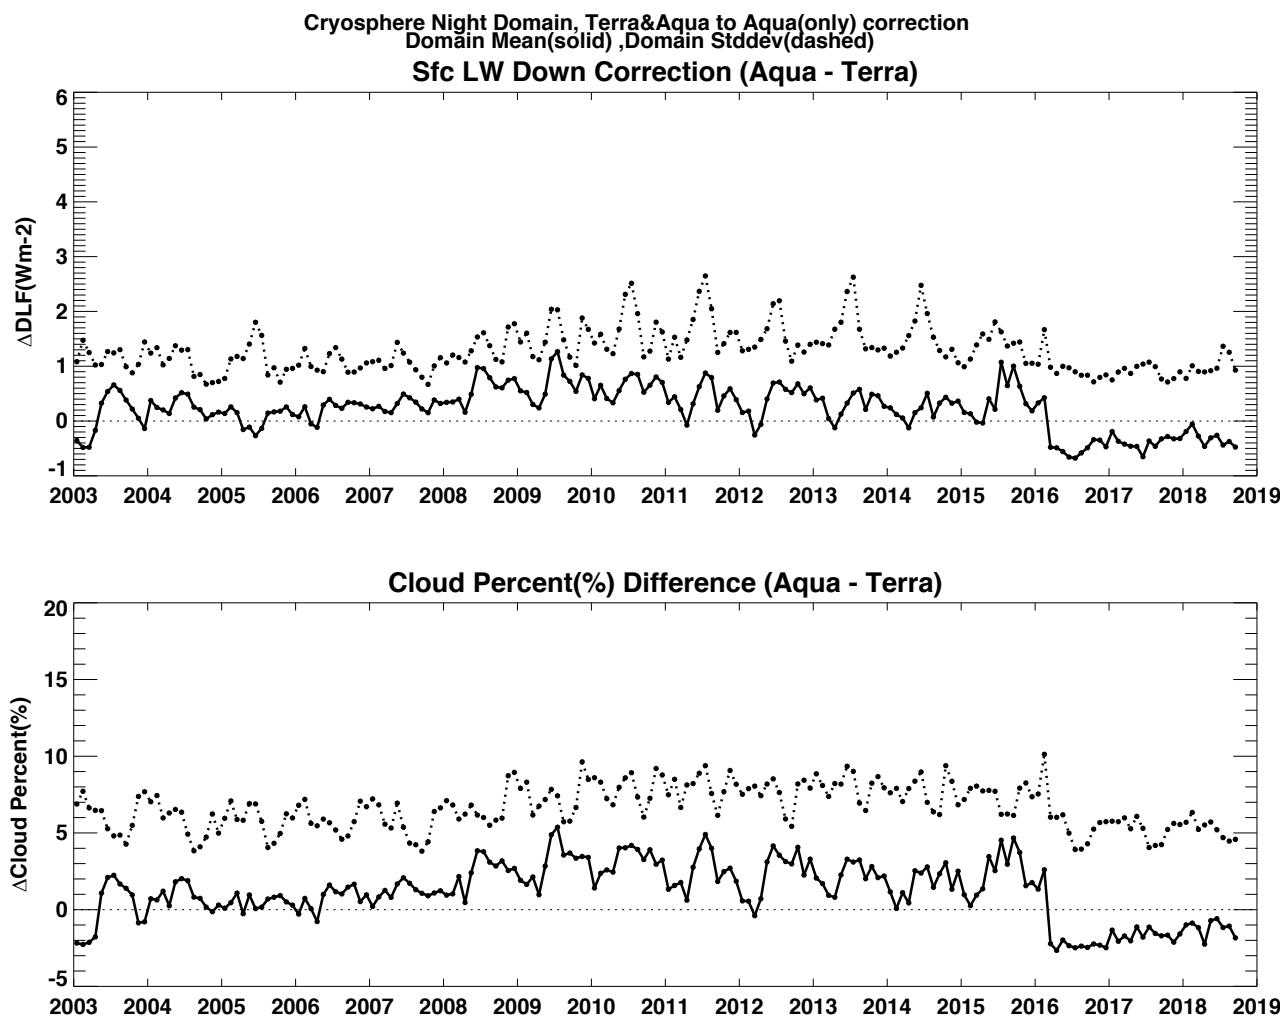

- Nighttime polar cloud fraction bias correction (60° to poleward) is applied from July 2003 through the end of the record to correct Terra cloud fraction.
 - Terra polar nighttime cloud fraction is adjusted to match Aqua nighttime cloud fraction.
- New Himawari 8 clouds is processed with correct input including corrected collocation of IR and VIS from July 2015.
 - Himawari-8, GOES-16, and GOES-17 are processed with the same cloud code.
- MODIS collection 6.1 aerosol optical thickness (and new surface albedo history map) is used for the entire time period.

Terra & Aqua Ed4.1 vs Ed4.0 Changes

Parameter	ED4.0	ED4.1
MODIS-collection	Terra-MODIS 6.7, 8.6 μm striping, March 2016 to March 2018	MODIS C6.1 resolved the Terra-MODIS 6.7, 8.6 μm striping
MATCH-Edition	Large discontinuity between MODIS C5 & C6.1 AOD inputs	Uses MODIS C6.1 AODs as input for entire CERES record
MODIS Clouds	Impacted Terra cloud properties	Terra cloud properties corrected beginning in Feb 2016
GEO Clouds	Him-8, GOES-16,17, Met-8,11 cloud codes with bugs	Consistent cloud code using MATCH Ed4.1, begin July 2015
Surface fluxes	The clear-sky SW down surface flux was impacted by MODIS C5 & C6.1 AOD discontinuity	SYN surface fluxes, computed using consistent GEO cloud code with MATCH Ed4.1 and tuned fluxes to correct GEO TOA flux

Ed 4.1 Sfc EBAF : Correction applied back to 2003

Time series of nighttime LW down bias correction averaged over nighttime Arctic and Antarctic

Actual bias correction is applied at a $1^\circ \times 1^\circ$ grid resolution

Correction is based on the nighttime cloud fraction correction applied to Terra cloud fraction correction

Assumption: nighttime monthly mean Terra cloud fraction over cryosphere is equal to the monthly mean nighttime Aqua cloud fraction

Summary of downward longwave flux bias correction

- Correction for monthly $1^\circ \times 1^\circ$ gridded all-sky and clear-sky surface and TOA LW fluxes due to the difference in temperature and specific humidity between AIRS and GEOS-5.4.1, using radiative kernels of Thorsen et al. (2018).
- Correction for monthly $1^\circ \times 1^\circ$ gridded all-sky surface LW fluxes for regions between 60° and 90° due to the difference in nighttime cloud fraction between Terra and Aqua, using radiative kernels of Thorsen et al. (2018).
- Correction for monthly 1° zonal all-sky LW fluxes based on the cloud fraction viewed from the surface derived from CALIPSO and CloudSat and MODIS and GEO-derived low-level cloud fraction, using radiative kernels of Thorsen et al. (2018).

¹ Net is defined as downward – upward

MATCH aerosols

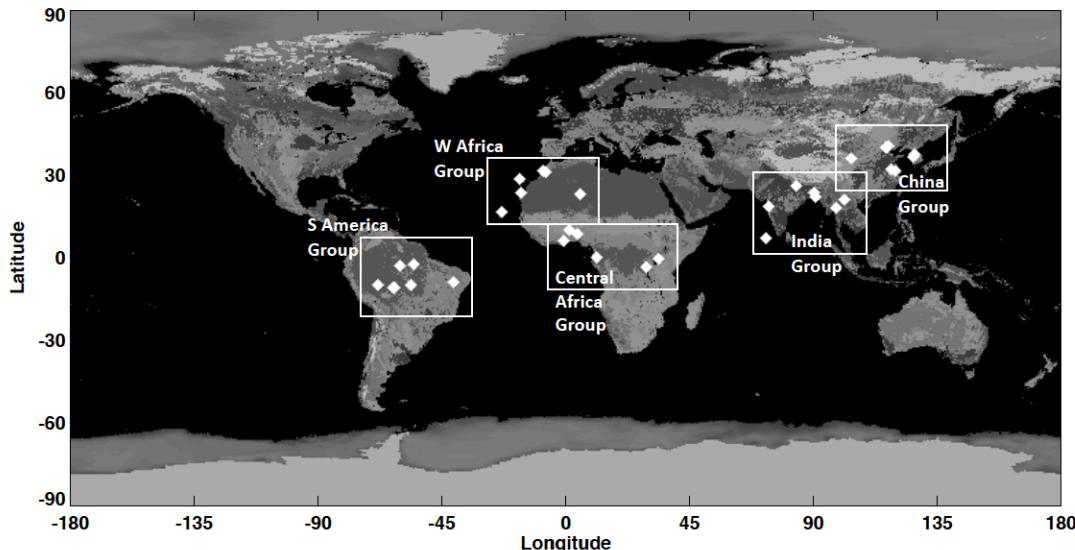

- Evaluate MATCH aerosols under partly cloudy conditions
 - When MODIS-derived aerosols are not available, temporally and spatially interpolated MODIS-derived aerosols are used in flux computations.
 - Water up-take as a function of relative humidity for hygroscopic aerosols (sulfate, sea salt, and soluble) is included.
- Interpolated aerosols affect EBAF clear-sky flux corrections

Evaluation of GMAO products

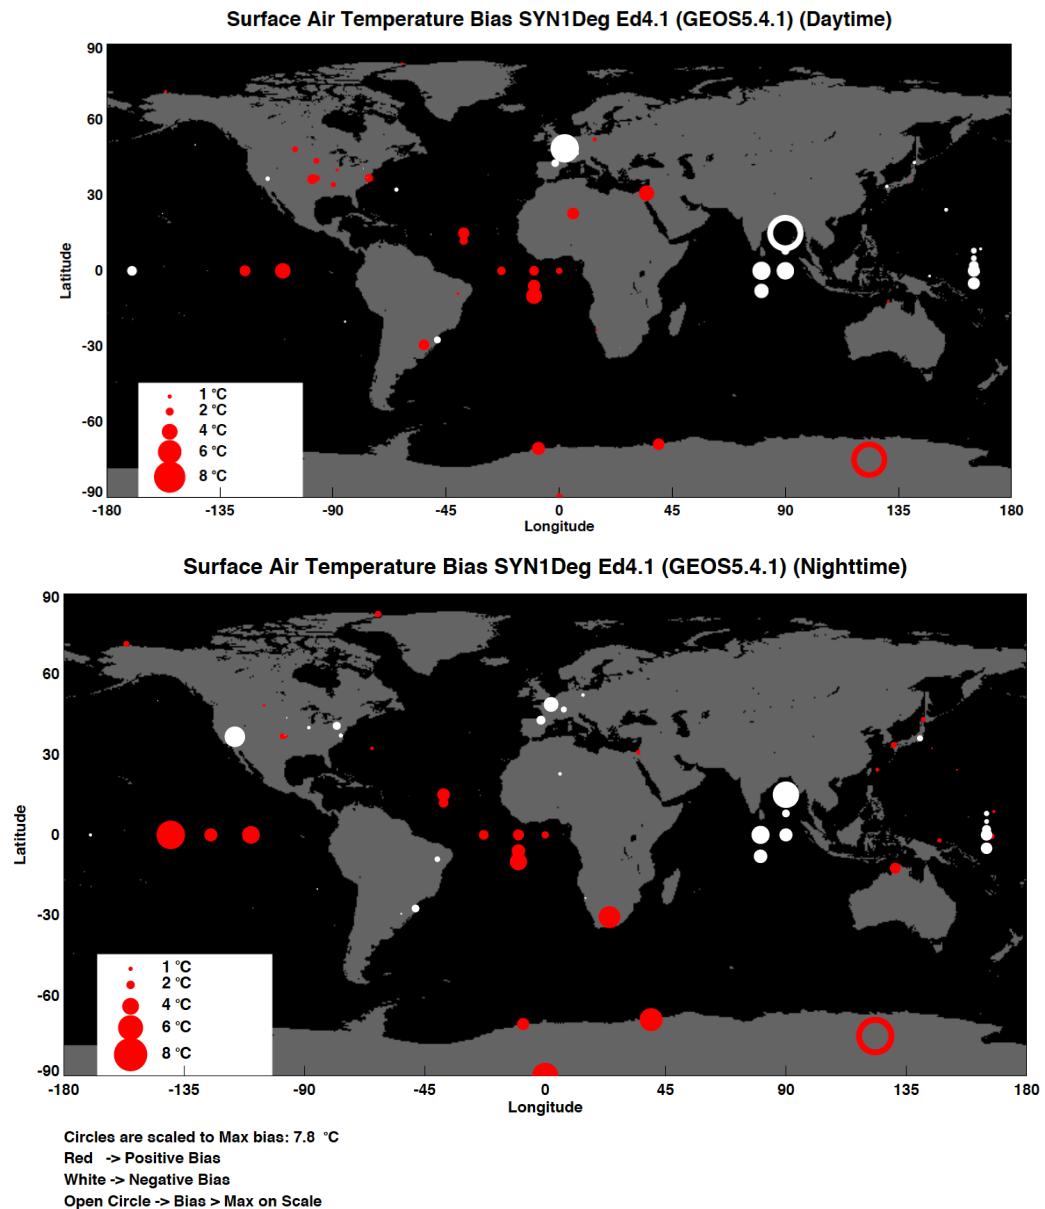

- Compare skin temperature from reanalysis products with skin temperature derived from MODIS when clear-sky is identified by CALIPSO and CloudSat
 - CERES footprint and GMAO grids selection criteria
 - Ground track within CERES footprints is clear
 - No clouds are reported in collocated GMAO grids
- Understand how skin temperature biases affect surface irradiance computations

Evaluation of skin temperature

Summary

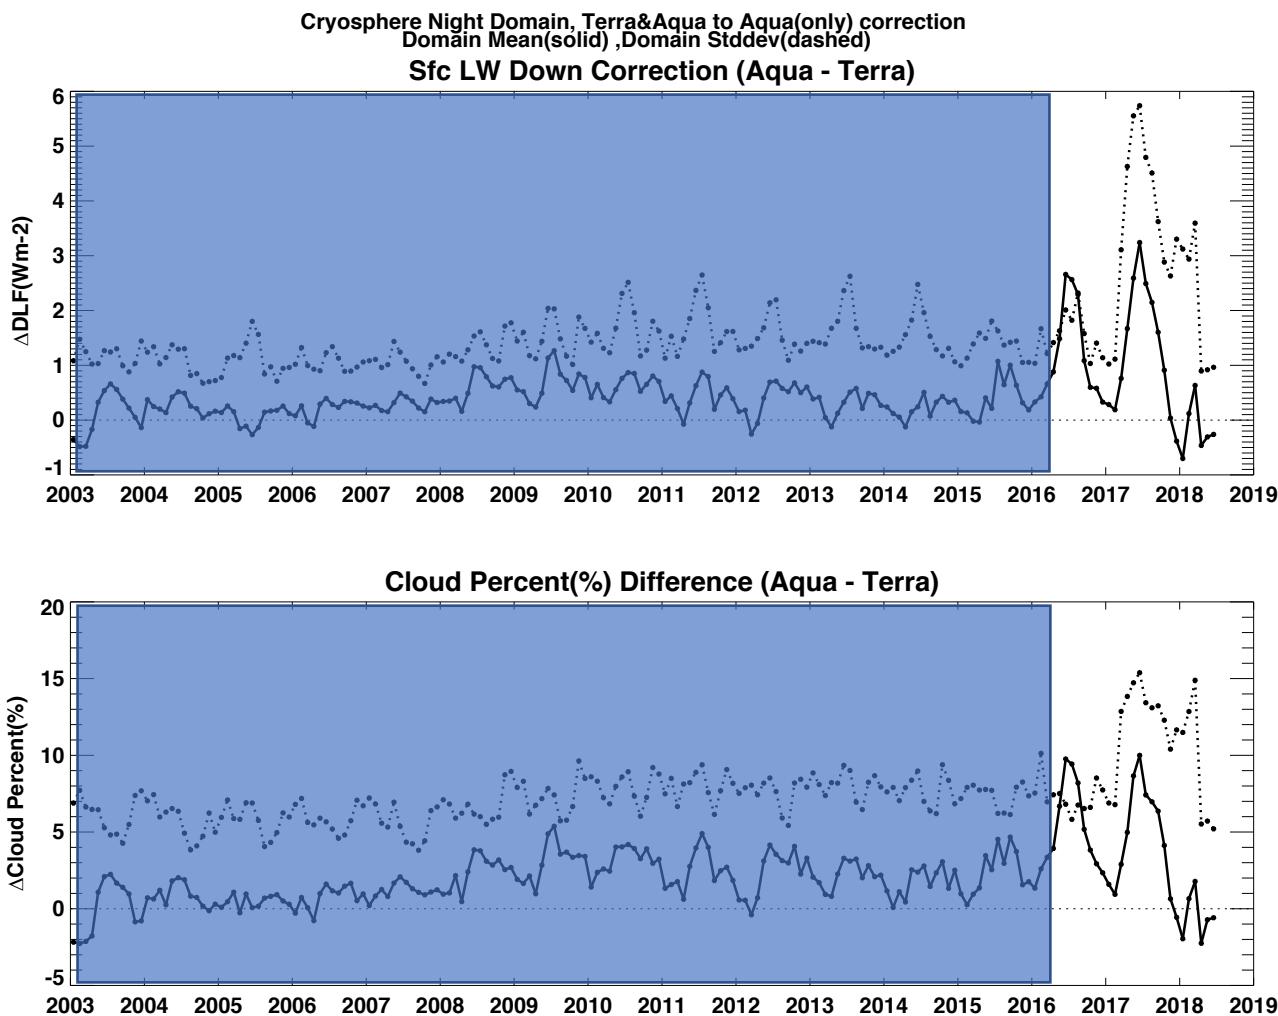

- Edition 4.1 EBAF-surface from march 2000 through September 2018 is produced and evaluated.
 - Significant change in shortwave surface fluxes over land especially for clear-sky conditions due to changes in the aerosol optical thickness. The difference is larger before February 2017.
 - Change in nighttime surface longwave fluxes over polar regions due to changes in polar cloud mask. Minor changes occur through February 2016 and significant changes occur from March 2016 onward.
 - Significant surface shortwave and longwave flux changes occur after July 2015 over western Pacific due to changes in cloud properties derived from Himawari-8.
- Edition 4.1 SYN1deg is produced with MODIS collection 6.1 aerosols.
- Need to revise land emissivity data in order to retrieve skin temperature and compute upward surface longwave fluxes for Edition 5.
